

Aurora Skincare System

Test Plan

Project Name: Aurora Skincare System

System Type: CLI (Command-Line Interface)

Prepared By: Dushiyanthan Sugumar

Date: 01/11/2024

Version: 1.0

Introduction

The purpose of this test plan is to systematically validate the Aurora Skincare Appointment Management System, ensuring the system meets functional and non-functional requirements. The system allows a receptionist to:

- Login and logout securely
- Add, view, update, and remove appointments
- Filter appointments by date
- Print bills and invoices
- Manage user credentials (username and password)
- Validate user inputs (Email, NIC, Mobile Number, Empty fields)
- Sign out and terminate the application

The testing is focused on manual functional testing of CLI operations, data accuracy, workflow validation, and input validation.

Test Objectives

1. Verify that all system functionalities work according to specifications.
2. Ensure that input validation and error handling prevent incorrect data entry.
3. Confirm that multiple appointments can be handled without conflicts.
4. Validate system outputs (confirmation messages, invoices, workflow transitions).
5. Ensure system stability and proper termination.

Test Scope

In Scope:

- Manual functional testing of all modules: Login, Main Menu, Appointment Addition, View, Update, Filter, Billing, Removal, User Management, Sign Out, Quit Program.
- Input validation for Email, NIC, Mobile Number, and empty fields.
- Verification of multi-appointment functionality.

Out of Scope:

- Automated testing (currently under study).
- GUI or web interface testing (CLI only).
- Performance, load, and security testing.

Test Approach

- **Manual Testing:** All test cases are executed step-by-step in the CLI application.
- **Test Case Documentation:** Each test case is documented with Test Case ID, Test Data, Expected Result, Actual Result, Status, and Remarks.
- **Screenshots:** Each test result is captured and referenced as Figure XX.
- **Input Validation:** Tests include correct and incorrect inputs to verify system response.
- **Sequential Execution:** Test cases follow logical workflow from login to termination.

Test Environment

- **System:** Aurora Skincare System CLI application
- **Platform:** Windows / Linux (CLI compatible)
- **Tools:** Notepad/Word for documentation, screenshots for test evidence
- **Test Data:** Sample patient data, appointment IDs, usernames, passwords

Defect Management

- **Logging:** Any discrepancies between Expected and Actual Results will be logged in a Defect Log.
- **Tracking:** Defects will be tracked with Test Case ID, Description, Severity, and Status.
- **Resolution:** All critical defects must be fixed before production release.

Risks and Assumptions

Risks:

- CLI-based system may limit visualization for testers unfamiliar with CLI.
- Input data errors may halt workflow if not handled properly.

Assumptions:

- All test data used are representative of real patient data.
- System modules operate in intended sequence without external dependencies.
- Screenshots are captured for all executed test cases as proof of validation.

Test Schedule

The testing of the Aurora Skincare System CLI application will be conducted in phases according to modules and workflow, with approximate timelines.

Phase / Module	Planned Duration (Days)	Responsible	Remarks
Test Planning & Preparation	1	Senior QA Engineer	Prepare test plan, test environment, and test data
Login Module Testing	0.5	QA Engineer	Validate correct and incorrect login functionality
Main Menu & Navigation Testing	0.25	QA Engineer	Verify menu options and invalid selection handling
Appointment Addition	0.5	QA Engineer	Test adding appointments with valid data
View Appointment	0.75	QA Engineer	Validate viewing appointments and error handling
Update Appointment	0.75	QA Engineer	Test updating appointments and handling invalid inputs
Filter Appointment by Date	0.5	QA Engineer	Validate filtering with correct and incorrect dates
Billing / Invoice Printing	0.5	QA Engineer	Test bill generation and error handling
Remove Appointment	0.5	QA Engineer	Validate removal with valid and invalid appointment IDs
User Management (Change Username & Password)	0.5	QA Engineer	Verify updates to username and password
Sign Out / Quit Program	0.5	QA Engineer	Test logout and program termination
Input Validation	0.25	QA Engineer	Validate email, mobile number, NIC, and empty fields
Multi-Appointment Validation	0.75	QA Engineer	Test adding multiple appointments at the same date/time with different doctors
Test Reporting & Review	1	QA Engineer	Compile results, attach screenshots, finalize test report

Total Planned Duration: ~7.5 days

Notes:

- Phases are sequential to ensure workflow continuity.
- Screenshots and evidence will be collected for all executed modules.
- Any defects found during execution will be logged, tracked, and retested after resolution.
- Duration assumes uninterrupted manual testing of the CLI system.

Test Deliverables

- Test Plan document (this document)
- Test Case Table with Execution Steps and Screenshots (Figures 01–34)
- Defect Log (if any issues are found during testing)
